**Homework 12**

---

**Exercise 1** Consider  $f : [a, b] \rightarrow \mathbb{R}$  continuous, and differentiable on  $(a, b)$ , and suppose that  $f'$  is also continuous on  $[a, b]$ . Show that the length  $\ell$  of the curve defined by  $\{(x, f(x)) \mid x \in [a, b]\}$  is given by the expression

$$\ell = \int_a^b \sqrt{1 + f'(x)^2} \, dx .$$

**Exercise 2** Let  $f : [a, b] \rightarrow \mathbb{R}_+$  be continuous and consider the volume of revolution generated by the rotation of  $\{(x, f(x)) \mid x \in [a, b]\}$  around the  $x$ -axis. Show that the volume  $V$  of this solid is given by the expression

$$V = \pi \int_a^b f(x)^2 \, dx$$

**Exercise 3** Let  $f : [a, b] \rightarrow \mathbb{R}_+$  be continuous, and differentiable on  $(a, b)$ , and suppose that  $f'$  is also continuous on  $[a, b]$ . Consider the surface of revolution generated by the rotation of the points  $\{(x, f(x)) \mid x \in [a, b]\}$  around the  $x$ -axis. Show that the surface  $S$  is given by the expression

$$S = 2\pi \int_a^b f(x) \sqrt{1 + f'(x)^2} \, dx .$$

**Exercise 4 (The painter's paradox)** Consider the function  $f : [1, b] \ni x \mapsto \frac{1}{x} \in \mathbb{R}_+$  with  $b > 1$ . In the setting of the previous two exercises show that for any  $b > 1$  one has  $V = \pi(1 - \frac{1}{b})$  while  $S > 2\pi \ln(b)$ . By considering the limit  $b \rightarrow \infty$  why do we get an apparent paradox ?
